Greetings

The Working Group II of the Intergovernmental Panel on Climate Change released its Sixth Assessment Report in February this year, stating explicitly for the first time that “human-induced climate change is causing widespread adverse impacts.” It highlighted extreme weather events, such as floods and droughts, as well as water scarcity, food crises, ecological crises and energy problems among the crises of concern that are facing humanity.

These are precisely problems of “water security”, which the Asia-Pacific Water Summit has been addressing these past 15 years.

In 2007, we organized the world’s first summit on the resolution of water-related problems in Beppu City, Oita Prefecture in Japan, with a focus on the Asia-Pacific region. I remember I had said in my opening remarks at the time that, “Our strategy must be to focus on how to adapt to these impacts of climate change.” And now, those words have become reality.

In 2019, the COVID-19 pandemic struck, and to this day, the world is still grappling with this crisis. Human history has long seen struggles with infectious diseases. And whether in the past or in the present, it is water that supports the health, sanitation and medical efforts to battle these infectious diseases. COVID-19 is a water and sanitation issue, while of course, overcoming this crisis is a human security issue.

Humanity has faced droughts, water pollution, pandemics and flood disasters many times throughout the past. In the Asia-Pacific region, we have worked hard to overcome these crises, sharing insights and lessons learned with each other. We will continue these tireless efforts.

Water is the source of life. It circulates around the earth and circulates in our bodies. In that sense, it is crucial to maintain and restore a sound water cycle.

Last month, the 9th World Water Forum was held in Senegal, Africa, and it called for global action toward “Water Security for Peace and Development.” In that vein, the discussions and outcomes planned for the 4th Asia-Pacific Water Summit are intended to lead to concrete actions for the Asia-Pacific region to achieve water security in the context of its environmental, economic and social connections. Hence, the outcomes of this Summit will be extensively disseminated throughout the international community and the wider world, including at the Midterm Review of the UN International Decade for Action “Water for Sustainable Development” and the UN Water Conference, which is scheduled for March next year.

As I close, please allow me to express my deepest gratitude once again to the Presidents, Prime Ministers and all those who have participated in the 4th Asia-Pacific Water Summit. I trust these two days will be valuable to actively discuss and share practical actions that will lead to enhancing the quality of all our societies.

Yoshiro Mori
Chair of the Joint Executive Committee of the 4th Asia-Pacific Water Summit
President of the Asia-Pacific Water Forum
Former Prime Minister of Japan
Greetings

I would like to sincerely welcome the leaders from the Asia-Pacific Region and those from various national and international institutions to the 4th Asia-Pacific Water Summit.

As a result of the ongoing COVID-19 epidemic that began two years ago, this summit was postponed by two years. I am extremely happy that we are now able to hold this hybrid in-person and online summit and would like to thank everyone who worked hard to make this possible.

Kumamoto City is located at the center of the island of Kyushu, the part of Japan closest to the rest of Asia. Kumamoto City is famous for its culture and history best exemplified by Kumamoto Castle, the lush greenery that has led Kumamoto City to be called the Forest City, and its status as one of the only cities in the world that can provide water for all 740,000 residents with its groundwater alone.

In order to preserve our bountiful groundwater resources for future generations, our residents, businesses, and local governments have worked together for years on groundwater preservation projects that transcend municipal boundaries. Our efforts have been recognized globally, both by being selected to host this summit and as the winner of the ‘Water for Life’ UN-Water Best Practices Award in 2013.

To date, summits have been held to further understanding and find answers for water-related issues facing the Asia-Pacific Region. At these summits, leaders of various countries and industries discuss methods for ensuring clean water and sanitation, as well as methods for mitigating risks of water-related disasters such as flooding and drought.

The theme of this summit is “Water for Sustainable Development: Best Practices and the Next Generation,” and we plan on holding discussions aimed at solving the various water-related issues involved in achieving Sustainable Development Goal 6: “Clean water and sanitation for all.”

Through this summit, we hope to inform the world about our groundwater conservation projects and help provide solutions to countries facing water-related issues. We also hope everyone will be able to witness the significant recovery Kumamoto City has made following the Kumamoto Earthquakes of 2016.

This summit will culminate in the issuance of the Kumamoto Declaration, which will be submitted to the UN 2023 Water Conference. We will do whatever we can in our power to make sure this declaration helps solve the ever more serious water-related issues we face, and we humbly ask for your cooperation in accomplishing this.

In conclusion, I would once again like to thank everyone from around the world who has helped with this summit, and I pray for the continued health and success of everyone involved.

Kazufumi Onishi
Mayor of Kumamoto City
Program

Day 1  23 April 2022 (Sat)

9:00

Opening Remarks  Mr. Yoshiro Mori
President of the Asia-Pacific Water Forum
Remarks  His Majesty the Emperor

10:00-11:30

Opening Ceremony

10:00

Greetings  Mr. Fumio Kishida
Prime Minister of Japan
Greetings  Mr. António Guterres
Secretary-General of the United Nations
Greetings from Host City
Mr. Kazufumi Onishi
Mayor of Kumamoto City
Report from the Asia-Pacific Water Forum
Mr. Mark Pascoe
Chair of the Governing Council of
Asia-Pacific Water Forum
Youth Declaration of Summit Opening

11:00

Commemorative Speech  His Majesty the Emperor

12:00

Lunch

13:00

Heads of State and Government Meeting
(Adoption of the Declaration Document and HSG Statement)

13:10-14:40

Symposium
Umi-to-Nippon
Project in Kumamoto

14:00

Coffee Break

14:10-15:40

Symposium
Kyushu Water Forum

15:00

High Level Statement

15:40-17:10

P1  Water and Disaster/Climate Change
P2  Water Supply
P3  Water and the Environment from Source to Sea

15:10-16:40

Symposium
Japan Aerospace Exploration Agency (JAXA)

16:00

Coffee Break

16:10-17:40

Symposium
Kyushu Water Forum

17:00

Showcase

17:30-19:00

P4  Water Poverty/Gender
P5  Water & Sanitation / Wastewater Management
P6  Youth Leadership & Innovation by Youth

17:10-18:40

Symposium
Japan Aerospace Exploration Agency (JAXA)
### Parallel Sessions

Outline

Water-related disasters intensified by climate change can directly affect artificial and natural environments. The impacts extend to the food-water-energy nexus and the socio-economic aspects of human societies. These closely related trade-offs require urgent responses, which more problems arise in other areas such as gender, equality, and peace. The world has learned through the COVID-19 pandemic that complex, cascading, and systemic risks usually implicit in social, economic, and environmental systems can be amplified by threat and harm across boundaries in space and time.

We need to prepare effective measures by scientifically analyzing climate change impacts on the environment, economy, society, and cultural and historical values.

Scientific assessments are possible using climate model outputs for hydrological and hydrodynamic simulation, prediction, and management systems. Practical adaptation measures should be selected according to appropriate assessments. The results obtained from monitoring and evaluating the implemented adaptation measures should be reflected in the decision-making process. All stakeholders need to work together to provide end-to-end solutions in gender-equitable, socially-inclusive manners by taking concerted, collaborative actions through tripartite cooperation among science and technology, governance, and finance.

This session will focus on urban water supply. Target 6.1 of SDGs set a global target to achieve universal and equitable access to safe and affordable drinking water by 2030 for all, in line with Government of Japan’s Roadmap 2030. Achieving this target will be a major challenge as the world faces growing water scarcity, pollution, and climate change.

Regarding science and technology, we will discuss the use of performance indicators to visualize the status of water services and management, the use of DX technologies, development of breakthrough technologies and the need to develop the capacity of institutions to use the technologies.

Regarding governance, we will discuss how to improve urban water governance in line with urban development and ensure that everyone, including informal settlement communities, has access to safe, affordable and reliable water service.

Regarding financing, we will discuss how sound management of water services is a prerequisite for effective conversion of funds into development benefits, and the importance of improving management of water utilities in order to mobilize private capital and to develop financial sustainability.

Outline

At this session, we would learn from the history of interaction between people sharing water as well as the relationship between people and water. The lessons science and technology to maintain or recover a sound water cycle including groundwater, and make recommendations for concrete actions toward quality-oriented related to the water cycle based on the knowledge obtained from science and technology, which is the basic goal of developing “quality infrastructure”.

will increase the risk of droughts and floods, while the use of renewable energy such as hydropower is expected to contribute to mitigation measures in the water sector.

subsidence, have been improved to a certain extent through the efforts of each stakeholder, but many issues still remain. In addition, there are concerns that climate change negative impacts from human activities. Therefore it is crucial to restore water and environmental systems and promote its adequate management. We are at a critical stage to preserve our habitats for the future.

For practical governance, business and culture of the next generations, the most essential aspect is understanding of the water and environment linkages and application of nature-based strategies in human-regulated water management. We, especially living in the Asia-Pacific region, have responsibility to conserve natural and social “Water and Environment” in a holistic manner from source to sea, through a multi-level governance for all stakeholders.

The discussion will focus on combination of economic development and environmental conservation building back better from the COVID-19 pandemic, collaboration between the public and private sectors, cooperation among local, domestic, and international stakeholders, the system of water environment adaptation and inclusive continuous governance, holistic and compiled scientific study, and green infrastructure improvement.

A comprehensive understanding of the links between poverty and gender and water is key to achieving sustainable water governance. This session will present cutting-edge examples from the Asia-Pacific region on water-related disaster risk reduction, gender equality, and sanitation that contribute to improving the livelihoods of socioeconomically vulnerable populations, and discuss practical policy formulations and interventions for sustainable development. Specifically, case studies will be presented from USAID’s work with the University of Peradeniya (Sri Lanka), the University of Technology Sydney, and the University of Tokyo, as well as Global Water Partnership and the International Water Management Institute who are working on poverty and gender issues in the water sector.

Based on these case studies, panelists from Asian countries will then discuss priority policies to promote poverty reduction and gender equality and make recommendations on the way forward. Other topics to be discussed include science-based climate adaptation measures that balance poverty and long-term water-related disaster risk reduction, and four areas of action to advance on gender equality (Institutional leadership and commitment; Gender inclusion and analysis that drives change; Meaningful and inclusive decision-making in development and partnerships; and Equal access to infrastructure and control of resources).

Target 6.3 of the Sustainable Development Goals (SDGs), enacted in 2015, set the goal of halving the proportion of untreated wastewater. In order to achieve this goal, it is necessary to further promote efforts to reduce the proportion of untreated wastewater, especially in the Asian and Pacific region where water pollution is increasing due to urbanization. However, the prevalence of wastewater treatment facilities is low in many countries of the region.

This parallel thematic session will focus on wastewater management in order to contribute to sustainable development and move towards achieving the SDGs by 2030, taking into account climate change and the recent transition in the situation of the world, and more specifically the Asia-Pacific region, due to the global epidemic of new coronaviruses. The main objective is to provide an opportunity for the governments of Asian and Pacific countries to collaborate on different topics (water quality, discharge criteria, budgets, legal systems, etc.) and determine measures that enhance wastewater treatment and re-use.

Youth are acknowledged as important actors in the achievement of development ambitions, including the Sustainable Development Goals. In the water sector, youth-led initiatives include peer- and community-focused education and behaviour change on water issues, clean-ups and other water management practices, innovation, research and policy advocacy, among others. Rather than working for youth, meaningful youth engagement emphasizes recognizing youth as “experts of their own issues” with valuable contributions to development. Youth and adults should work collaboratively in shared value partnerships so that there is a sharing of expertise and knowledge between both parties; creation of value for both partners; having common objectives, joint ownership and shared decision-making; and building a partnership based on foundations of trust, respect and reciprocity.

In this session, we will gain an insight into the meaningful intergenerational partnership pathways at all levels and discuss how they can be strengthened for water security and resilience in the Asia Pacific region.

This Thematic Session will promote proper methods and technologies for increasing productive or efficient and inclusive water use in agriculture (irrigation) in East, Southeast, South and Central Asia, with regard to SDGs Target 6.4, through sharing lessons and experiences in these regions. The Session will also clarify the effective connectivity with other SDGs Targets such as Target 7.2, shifting to renewable energy with utilizing small-scale hydropower and solar system, Target 13.1, strengthening resilience and adaptive capacity to climate-related hazards and natural disasters as well as Target 2.4, with proper agricultural water management.

Peace in international water courses is intricately bound to water issues. As water is fundamental source for lives and livelihood of people and a key element for the environment, every shortcoming or water scarcity has been of major concern for leaders, politicians, diplomats, stakeholders and citizens. Such concern and awareness are heightened in particular when water is in extreme status.

Water hazards such as floods, droughts and water pollution in international water courses can lead to tensions among countries. At the same time, water-related hazards can become an opportunity to foster peace among riparian countries by their sharing of critical information and by their extending support to affected countries. Countries and stakeholders have hope for lasting solutions and better relations by jointly overcoming water crisis. Peace through water crisis, however, does not automatically happen. Countries and stakeholders should be prepared and share information in order to build peace before, during and after water crisis.

In the process of fostering peace and cooperation through water, it is critical to respect cultural and historical relationship between people and water in the riparian countries since water has been closely associated with human being since ancient civilizations period. It has interacted with the people in critical fields for their existence such as health, food, energy, disasters, and environment. Therefore, relations between the people and water are not only physical and practical but emotional, philosophical, and even spiritual, so it affects the people’s way of thinking and beliefs.

At this session, we would learn from the history of interaction in sharing water as well as the relationship between people and water. The lessons gleaned from the exercise will give us a clue to create better paths towards holistic and sustainable development and peace of regions with no one left behind.

The available water resources are part of a continuous “water cycle,” and maintaining a “sound water cycle” is extremely important for developing a “quality society” that is sustainable, inclusive and resilient.

In the Asia-Pacific region, serious issues related to the water cycle including groundwater, such as water pollution, droughts, floods, depletion of groundwater and land subsidence, have been improved to a certain extent through the efforts of each stakeholder, but many issues still remain. In addition, there are concerns that climate change will increase the risk of droughts and floods, while the use of renewable energy such as hydropower is expected to contribute to mitigation measures in the water sector.

It is important to share various experiences from the conference of “maintenance of a sound water cycle” among stakeholders in each area related to the water cycle based on the knowledge obtained from science and technology, which is the basic goal of developing “quality infrastructure.”

Based on the current status and regional characteristics of the water cycle in the Asia-Pacific region, this session will share knowledge on governance, finance, science and technology to maintain or recover a sound water cycle including groundwater, and make recommendations for concrete actions toward quality-oriented society that should be taken by countries in the Asia-Pacific region in the future.
## Integration Sessions

<table>

<th>Date &amp; Time/Room</th>
<th>Outline</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Integration Session 1</strong>&lt;br&gt;Science &amp; Technology</td>
<td>Day2: 24 April (Sun) 14:00-15:30 (Conference Room A1)</td>
<td>The preamble to the UN’s 2030 Agenda, which sets out the Sustainable Development Goals, states, “We are determined to take bold and transformative steps towards ending poverty and hunger, protecting the planet, and promoting peace and prosperity for all.” The SDG framework provides a shared set of goals and targets for achieving sustainable development, and the success of this agenda will depend on how effectively water is integrated across different sectors and stakeholders. This session will focus on the transformative role of water as a catalyst for achieving the SDGs and the need for concerted efforts at all levels to address water-related challenges. It will discuss how water can be effectively mainstreamed into other sectors and how to ensure that water-related goals are integrated into national, regional, and local development plans. The session will highlight success stories and good practices in water management and governance, as well as the challenges and opportunities that arise in different contexts. The session will also address the role of science and technology in supporting water-related efforts, including the development of innovative solutions for water scarcity, pollution, and security. The session will conclude with a discussion on the importance of collaboration and partnerships, and the need for sustained investment in water infrastructure and services.</td>
</tr>
<tr>
<td><strong>Integration Session 2</strong>&lt;br&gt;Governance&lt;br&gt;Encouraging Collaboration of All Stakeholders across Sectors and Generations to Achieve Water-related SDGs</td>
<td>Day2: 24 April (Sun) 14:00-15:30 (Conference Room A2)</td>
<td>Water management including water-related disaster risk management and governance of water services is a challenge that requires the involvement of various stakeholders at multiple levels, from public, private and NGO sectors at all stages of decision-making, policy-planning, and collective action. Water-related policies are complex, as they are strongly associated with vital spheres such as health, environment, agriculture, energy, planning, regional development, and poverty eradication. Water governance is the range of political, social, economic, and administrative systems in place to develop and manage water resources, and deliver of water services at different levels. It emphasizes the need for cross-sectoral and multi-level coordination and for a holistic framework to ensure that water is managed holistically. Integrated Water Resources Management, enshrined in the SDGs, is not only a means to monitor water governance at global, regional, country, and river basin scales but also a process which can provide the framework to advance water security. This session will refer to key water governance processes including Asian Water Development Outlook 2020 and SDGs, integrate perspectives from three parallel thematic sessions; and deepen discussions for improving water governance in accordance with the four IWRM dimensions, leading to the formulation of recommendations for the Summit.</td>
</tr>
<tr>
<td><strong>Integration Session 3</strong>&lt;br&gt;Finance&lt;br&gt;How to Maximize Investment and Financing on Water Projects to Achieve Water Goals and Targets in the Post COVID-19 Era</td>
<td>Day2: 24 April (Sun) 14:00-15:30 (Conference Room A3)</td>
<td>Water is essential for sustaining human life, human security, the environment, and the economy and is at the core of sustainable development. However, progress on internationally agreed goals and targets such as SDG6 and water-related disaster risk reduction has been lagging even prior to the outbreak of the COVID-19. Lack of funds is one of the causes of the delay. According to the UN water, it is estimated that achieving SDG 6.1 (universal and equitable access to safe and affordable drinking water) and SDG 6.2 (adequate and equitable access to sewage and sanitation facilities) alone will require US$114 billion per year to close the gap with the necessary investment. It is also pointed out that there is a significant investment gap in sustainable water resources management, which cannot even be estimated. Regarding the disaster risk reduction, only about 4% was used as proactive measures to improve the current situation fundamentally. In this session, we will explore how we can maximize the investment to address water and disaster issues in (i) government sectors, (ii) private sectors and how we can efficiently combine the i) and ii) by integrating the inputs from previous sessions and good practices obtained by water and disaster management in the Asia Pacific region.</td>

</table>
| **Overall Integration Session**<br>Building Post-Corona World Back Better through Water -Actions and Commitments from Kumamoto to the World- | Day2: 24 April (Sun) 16:00-17:30 (Main Hall) | The Overall Integration Session will be held to integrate messages and advice of the three previous integration sessions of (i) governance, (ii) finance, and (iii) science and technology in order to produce a clear-cut answer to the inquiry posed by Heads of State and Government in the Kumamoto Declaration. Special attention will be given in the discussion and outcome to synchronize the outcome of Kumamoto Summit with previous and succeeding preparatory process such as Bonn Conference, the 9th World Water Forum, and 2022 Dushanbe Process to deliver common messages to the UN 2023 Midterm Review Conference. As the 4th Asia Pacific Water Summit (APWS) is one of the key preparatory processes towards the UN 2023 Midterm Review Conference, this process is to accelerate actions by all towards achieving internationally agreed targets on water through collaboration, partnership, enabling environment, youth and others. This conference will be an opportunity which we can bring to scale and become catalyst for the UN 2023 Midterm Review Conference. The transformative role water should play towards full achievement of SDGs and building resilient, sustainable and inclusive post-corona society will be discussed. Concrete ways for improving governance, finance and applying science and technology in integrated and integrated global-

<tr>
<td>Showcase</td>
<td>Day1: 23 April (Sat) 17:30-19:00 (Main Hall)</td>
<td>Water is essential for human life and wellbeing. It provides a bridge among atmospheric, oceanic and terrestrial natural sciences and socio-economic benefit areas including agriculture, forestry, health, energy, economy and human settlement. Water-related issues are critical in Asia and Pacific. Flood and drought prediction and warning systems are urgently needed. Water discovery and water resource development are essential for survival. Good water quality is essential for human health. Climate change is now a fundamental threat in this region. The Covid-19 pandemic suddenly threaten humanity beyond boundaries in space and time. On-site stakeholders should develop integrated scenarios and execute concrete measures by sharing the understanding of water-related benefits and risks through cross-sectoral dialogue with the science and technology community; and making maximum use of global monitoring and prediction information as a public good as well as local and indigenous knowledge. It is also important to foster the human resources as catalytic beings who has functions to moderate meetings, to lead toward resolving problems, and to provide professional advice on-site. Tripartite cooperation among science, policy and operation is essential at different spatial scales and in thematic and functional terms. This special session shares four cases ranging from local to national levels as lessons learnt.</td>
</tr>
<tr>
<td>Small Islands State (SIS) session</td>
<td>Day2: 24 April (Sun) 9:00-10:30 (Conference Room A3)</td>
<td>SIDS have many specific challenges due to their geographical and climatic characteristics. SIDS in the Pacific occupy a quarter of the 49 countries targeted by the Asia-Pacific Water Summit. Therefore, it is indispensable to discuss the SIDS-specific water problems when discussing regional water issues in Asia and the Pacific. At the First Asia-Pacific Water Summit held in 2007, the &quot;Small Island Developing States Dialogue on Water and Climate&quot; was held by top-level leaders of the SIDS. At the &quot;Breakfast Briefing Meeting for the Fourth Asia-Pacific Water Summit&quot; targeting the UN Missions of the Asia-Pacific Countries in New York in December 2021, all Permanent Representatives of SIDS pointed out the importance of the unique and common problems and their vulnerabilities. Many have said that this summit will be an opportunity to focus the world’s attention on the issues of the Pacific Island nations. Likewise, Australia, which has been demonstrating leadership in the region, also emphasizes the importance of tackling the problems of the Pacific Island nations. The objective of the &quot;Special High-level Session for the Small Island States&quot; at the Fourth Asia-Pacific Water Summit on April 23rd-24th, 2022 in Kumamoto, Japan (hybrid in-person and virtual format) is to discuss SIDS-specific water issues, including how to address their vulnerability to disasters due to climate change. It is expected that the results will contribute to connect organically the SIDS-specific water issues to the discussion towards the implementation and achievements of the global goals including the Sendai Framework, SDGs, and The Paris Agreement, as well as future actions. This session also aims to encourage the participation of heads of government from countries in the Pacific. The results of the discussions will be reflected into the outcome document of the Asia-Pacific Water Summit, and will also contribute to The 7th Global Platform for Disaster Reduction in May 2022 in Bali, The Asia-Pacific Ministerial Conference on Disaster Risk Reduction in September 2022 in Brisbane, and midterm reviews of the global goals including the Water Action Decade, Sendai Framework, SDGs, and conferences of the parties, and other important milestones, in anticipation of having substantial impact on the Midterm Review of the Water Action Decade in 2023 and the 4th International Conference on Small Island Developing States (SIDS) in 2024.</td>

### Outline of the Event

**Kumamoto uses a bounty of groundwater and is supported by a rich ocean. However, the problem of marine debris is becoming a worldwide concern, and Kumamoto’s oceans are no exception. Much of the marine debris is thought to be discarded by people living in towns and cities and washed into the ocean via rivers. Microplastics, in particular, are impossible to recover, and there are concerns about their impact on the ecosystem. The results of the elementary school students’ studies on these issues will be shared with the world, and proposals will be made to reduce marine litter to zero.**

**Sustainable uses of water and environmental conservation requires continuous efforts by a diverse group of people. Kyushu is a region blessed with nature, and have been leading fulfilling lives in terms of history and culture. Diverse people of many generations have been continuously working together to protect the well-being of water, overcome water-related disasters, and create social systems. In recent years, from the perspective of the SDGs, global initiatives from Kyushu have also become indispensable. This time, from the perspective of Kyushu in the Asia-Pacific region, people connected by water will discuss and consciously formulate sustainable life with water, connecting the region, Japan, and the world.**

**The Asia-Pacific region is vulnerable to climate change, especially water related disasters. To mitigate this water related disaster and reduce disaster damage, it is necessary to improve the forecasting ability from short-term weather forecast to long-term climate change forecast with current situation monitoring using space-based technology, especially earth observation. To this end, this side event will be held by JAXA with the cooperation of related domestic and overseas organizations to promote discussions on this issue.**

---

**Outline of the Event**

- **Kyushu in Asia and the Pacific**
  - Talks on Sustainable Life with Water by People Linked with the Water in this Area
    - Kyushu Water Forum
  - Sustainable uses of water and environmental conservation requires continuous efforts by a diverse group of people. Kyushu is a region blessed with nature, and have been leading fulfilling lives in terms of history and culture. Diverse people of many generations have been continuously working together to protect the well-being of water, overcome water-related disasters, and create social systems. In recent years, from the perspective of the SDGs, global initiatives from Kyushu have also become indispensable. This time, from the perspective of Kyushu in the Asia-Pacific region, people connected by water will discuss and consciously formulate sustainable life with water, connecting the region, Japan, and the world.

- **Space Technologies for Addressing Water Issues**
  - Japan Aerospace Exploration Agency (JAXA)
  - The Asia-Pacific region is vulnerable to climate change, especially water related disasters. To mitigate this water related disaster and reduce disaster damage, it is necessary to improve the forecasting ability from short-term weather forecast to long-term climate change forecast with current situation monitoring using space-based technology, especially earth observation. To this end, this side event will be held by JAXA with the cooperation of related domestic and overseas organizations to promote discussions on this issue.

---

**Outline of the Event**

- **Forum of Town Planning with Disaster Prevention of the Water in Kumamoto 2021**
  - You Can Do Improvement of River Basin for the Tomorrow’s Flood
  - We learn about a disaster of the water which is frequent with recent global warming in the world, and basin river improvement in Japan. And We plan improvement of awareness about the water disaster prevention, by exchanging opinions in the viewpoint of inhabitants about experience, reflection and the measures of the water disaster in Kyushu.

- **“Kumamoto, Land of Water” Symposium**
  - Groundwater Preservation Efforts in the Kumamoto Area
  - In Kumamoto City and its surrounding municipalities, almost 100% of the domestic water is supplied from groundwater. We would like to explain why there is such an abundance of groundwater in Kumamoto Prefecture and the unique water cycle process. We would also like to introduce the efforts of the citizens, the private sector, and Kumamoto Prefectural government to conserve groundwater so that we can pass on to future generations the blessing that is our precious groundwater.

- **The Role of Forests in Contributing to Water Infrastructure**
  - Forestry Agency
  - Kumamoto City, one of the organizers of the 4th Asia-Pacific Water Summit, has been promoting various policies for groundwater conservation, including forestation to maintain water resource conservation function of forests. Japanese government also promotes forest maintenance and conservation for fulfillment of the multiple functions of forests, including the water resource conservation function, under the Basic Plan on Water Cycle. Our symposium focuses on forests as an important element that contributes to water infrastructure. We provide the latest findings through lectures, case studies and the panel discussion to deepen understanding of the importance of forests and to foster momentum for forest maintenance and conservation.

A panel exhibition on water-related initiatives in the Kyushu region, such as "Water Circulation," "Efficient Use of Water," "Water Environment" and "Flood Control," will be held to raise awareness and disseminate information about water.

TAISEI CORPORATION from the day of establishment in 1873 makes full use of construction technology and contributes to making the domestic and international environment in the world better. When we decide to enter into a brand new field in the world, we consider that participation in the development of overseas water infrastructure business and development of PPP business is indispensable. In order to introduce to four techniques on water, we introduce the construction results of buildings and civil engineering in Kumamoto. Furthermore, we play a video of Shin-Aso bridge, tsunami analysis and the Bososorus tunnel.

In addition to traditional needs such as increased water demand due to urbanization and economic development, Asian countries are facing increasing needs for water resource management, such as "climate change" and "deterioration of existing facilities." As an effective countermeasure to these issues, we propose "dam upgrading projects" that can maximize the capacity of existing dams and reservoirs.

In addition, we will introduce our achievements in dam upgrading and integrated water resources management (IWRM) in Japan and our technical assistance to foreign countries with some practical examples.

In cooperation with the river administrator and residents, we will have panel displays and presentations by high school students on (1) History of the lower reaches of the Kuma River, (2) Environment of the lower reaches of the Kuma River, (3) Torrential flooding disaster of July 2020, and (4) River development in cooperation with the city. We look forward to seeing you at the venue.

We are carrying out the local electric power business in Kumamoto-shi.
We introduce our business.

Disaster prevention well system equipped with a hand operated pump that uses Kumamoto’s abundant groundwater to secure a large volume of clean domestic water, which is the most difficult thing to do in times of disaster, even in the event of a power outage during a disaster

Introducing projects improving the water area environment by eliminating exotic species in the "Tsuruta Dam Emergency Water Surface Cleaning Work" conducted over 3 years at the Tsuruta Dam in Satsuma District, Kagoshima Prefecture, protection and regeneration of rare and endangered species at Oku-Niko Marsh (Yuno Lake) and the old port of Hikone-city, the recycling of harvested waterweeds, and the overseas export results of our technology to the Republic of Malawi (JICA / Indonesia).

In addition to the functions of conventional solar water heaters, pure water (distilled water) can be generated with solar heat energy. It is a product that can be collected at the same time as drinking water and hot water supply. Since rainwater and river water can be used, it can also be used to purify rainwater in natural resources, as well as water for athletes with undeveloped or insufficient water resources.

The climate change adaptation countermeasures such as flood risk management will greatly contribute to achieving the SDGs. However, this is not widely recognized in Japan. Therefore, the Lower Arakawa River Management Office (MLIT) is promoting the integrated flood risk management campaign connected to SDGs. Furthermore, the office is leading the advanced river management by DX (Digital Transformation) and with multi-stakeholder partnership through GI (Green infrastructure) actions.

In order to realize Society 5.0 for Disaster Management, the SIP R&D of new technologies to strengthen national resilience "System for Ground Water Use during Disasters and Critical Water Shortages" and "Integrated-System of Disaster Reduction for Municipalities System (IDR4M)" are exhibited and introduced to support disaster response operations in the aftermath of wind and flood disasters that are becoming more severe due to climate change.

A plan to experience the deliciousness of Kumamoto’s water by comparing the water of the world with the water of Kumamoto

The original form of Aso was created by four previous catastrophic eruptions. The pyroclastic flows have covered northern part of Kyushu and crossed over the sea to Yamanouchi Prefecture. These eruptions probably changed the global environment at that time. However, this catastrophic environment is what created the lands of Aso and Kumamoto, and is the source of abundant groundwater. In this booth, we will introduce the unexpected relationship between Aso’s tourist attractions and Kumamoto’s groundwater.

Paddy fields in the middle reaches of the Shirakawa River nurture Kumamoto’s groundwater
Paddy fields in the middle reaches of the Shirakawa River(Ozu town and kikuyo Town) allow water to seep through more than five times easier than in other areas creating a lot of groundwater

The Kumamoto Region (11 municipalities bounded by Aso to the east and the Airaike Sea to the west) is home to 1 million people who share the same groundwater resources. Groundwater conservation projects involve many people from different towns and cities. This booth introduces the Winter Paddy Flooding project implemented in the Tsumori area of Masaki by local farmers and Suntrust as well as the rice paddy rebuilding efforts and creative recovery by Suntrust following the April 2016 earthquakes

Let’s take a look at the underground water circulation mechanism with this trajectory map. On this map with underground water flows, why not put this on the map of Masaki. You will be able to understand the underground water. In addition, we hope you take an opportunity to consider the issue of micro-plastics, one of the challenges of the day: How are they affecting agriculture?

Local elementary school students and their parents will make a presentation on the groundwater and its system in the Kumamoto City and Prefecture in English. We’ll have an exhibition in photos and video of our recent summer programs for kids and their parents.

In addition, we are delighted to show a film on some of Kumamoto’s cool historical sites - they’re not only historical, but green.

We introduce our research and education related to water and natural environments and our works for the development of Kumamoto.

We are going to show videos produced by Japanese high school students on a monitor, content on posters, flyers, exhibits.

Presentation of activity reports and exhibition of works by high schools who would like to present during on the venue. Online discussion with overseas youth of the same generation (under consideration).

The "Erfeng Canal" is located in Pingtung, the southernmost county in Taiwan. This canal was built between 1921 and 1923, and it’s underground weir, which is a sustainable construction that make good use of the area’s natural environment and water characteristics, not only resolved the area’s chronic shortage of water during the annual dry season, but also provided a robust water-supply system that constantly meets the needs of villages in the area for about 100 years. The exhibition will introduce the location, history, construction, repair and preservation of the "Erfeng Canal".

Japan Aerospace Exploration Agency (JAXA) is developing and operating various satellites to address global water-related issues. The exhibit introduces JAXA’s earth observation satellites and what kind of information can be obtained from space. We will also introduce specific examples of how water-resources related activities are being utilized in various fields such as agriculture, disaster prevention, and meteorology.

In December 2007, the first Asia-Pacific Water Summit was held in Beppu City, Oita Prefecture. Fourteen years have passed since then, and the citizens, businesses, and government of the prefecture have worked together to rebuild after repeated disasters. However, there are still concerns about the chronic shortage of water during the annual dry season, but also provided a robust water-supply system that constantly meets the needs of villages in the area for about 100 years. The exhibition will introduce the location, history, construction, repair and preservation of the "Erfeng Canal".

Shiga Prefecture is home to Lake Biwa, the largest lake in Japan. Many, including the government, citizens, researchers and businesses, have made concerted efforts to conserve and restore the Lake’s water environment. This booth focuses on Lake Biwa and the cooperative efforts of the people of Shiga, following three themes:

(1) Water environment of Lake Biwa and the Great Lake Goals (MLGs) (a Lake Biwa version of the SDGs)
(2) Lake Biwa and the natural environment in Shiga
(3) Water environment businesses in Shiga that have been nurtured around Lake Biwa

- Sustainability framework in Japan’s Coca-Cola systems
- Water source replenishment activities
- World Without Waste

We established the Mizkan Center for Water CultureTM in 1999 because water has played a vital role in our business from the very beginning. The Mizkan Center for Water CultureTM works to enrich people’s lives by exploring our relationship with water.

To give an idea of what we do, we will share the “Kumamoto,” “Higashikawa-cho, Hokkaido,” and “Gen Z” issues of our magazine, published in FY21. Through this exhibition, we hope to raise awareness of the importance of water and inspire gratitude for water.

Introduction of Kumamoto City

1 About Kumamoto City
Located between Mt. Aso in the east and the Ariake Sea in the west, Kumamoto City is a metropolis blessed with clear groundwater and a lush natural environment overflowing with greenery. The city developed around Kumamoto Castle, the symbol of Kumamoto, and became an urban center in the middle of Kyushu due to its excellent geographical position.

2 Kumamoto – the Forest & Water City
Kumamoto City boasts many relaxing areas with plenty of water features and greenery like Suizenji Jojuen Garden and Lake Ezu. Suizenji Jojuen Garden is a Momoyama-style stroll garden created in 1636 around a teahouse belonging to the Hosokawa Clan, who ruled over the Kumamoto domain at the time, and it has been designated as a Historic Site and a Place of Scenic Beauty by the national government.
Lake Ezu is made up of two smaller lakes, Kami-Ezu and Shimo-Ezu, with a total perimeter of about 6 km. It is unusual to have such a lake in the middle of a city, and its boardwalks and other facilities have made the lake a popular place for relaxation and recreation among city residents.

3 Japan’s Number One Groundwater City
Despite its large population of 740,000 people, Kumamoto City’s entire water supply comes from natural, pure groundwater. Not only is it the only city in Japan with a population over 500,000 that can say this, but it has few peers on the international scale, as well.
The strata in the Kumamoto region formed by the eruption of Mt. Aso are filled with numerous crevices that allow water to soak into the ground quite easily. The rain that falls on the mountains of the Aso region seeps into the earth and flows down to the city over the course of about 20 years. During that period, the water absorbs many minerals and eventually becomes delicious and healthy mineral water. This means that the city’s environment allows us to provide residents with mineral water straight from their taps.

4 Produce and Foods Nurtured by Clear Groundwater
Blessed with clear groundwater and other natural resources, Kumamoto City produces a variety of agricultural products such as rice, vegetables, fruits, flowers, and livestock, making it tenth in agricultural output among Japanese municipalities (as of 2019). Kumamoto specialties include horse-meat sashimi (basashi), lotus root stuffed with mustard (karashi renkon), and Kumamoto ramen, but the natural water we pride ourselves on and other dishes made from ingredients nurtured by that water should make one think that everything here is delicious!

5 Kumamoto Castle – Symbol of Kumamoto and Its Reconstruction
Kumamoto Castle is among Japan’s three great castles and is said to have been built over seven years by Kato Kiyomasa, the first feudal lord of the Kumamoto domain and a legendary castle builder. The castle’s keeps, stonewall, buildings, important cultural properties, and many other features were damaged by the Kumamoto Earthquake in April 2016, but due to our ongoing restoration work, the castle keeps’ reconstruction was completed in April 2021.
Organizational Structure of the 4th APWS

Co-organizers

- Asia-Pacific Water Forum (APWF) (Secretariat: Japan Water Forum)
- Kumamoto City
  * Cooperation of the Government of Japan to conduct the necessary cooperation under the cabinet approval by ministers concerned to implement the 4th APWS

International Organizations, etc., who cooperate with the APWF activities (co-host)

- Asian Development Bank (ADB)
- United Nations Economic and Social Commission for Asia and the Pacific (UNESCAP)
- United Nations Educational, Scientific and Cultural Organization (UNESCO)
- The Food and Agriculture Organization of the United Nations (FAO)
- United Nations Human Settlement Programme (UN-HABITAT)
- Executive Committee of the International Fund for Saving the Aral Sea (EC-IFAS)
- Global Water Partnership (GWP)
- GWP China
- GWP CACENA
- GWP South Asia
- GWP Southeast Asia
- High-level Experts and Leaders Panel on Water and Disasters (HELP)
- International Centre for Water Hazard and Risk Management under the auspices of UNESCO (ICHARM)
- International Centre for Integrated Mountain Development (ICIMOD)
- International Union for Conservation of Nature (IUCN) Asia
- International Water Management Institute (IWMI)
- International WaterCentre (IWC)
- Japan International Cooperation Agency (JICA)
- Japan Sanitation Consortium (JSC)
- Japan Water Agency (JWA)
